

# Usability Testing

By William Atkinson

## Scenario

You are a student who is looking for a better way to keep track of your schoolwork. You have trouble with time management so ideally you would have an application to help you remember your assignments.

### Task 1:

Open the app and complete onboarding by entering your name, university, and what year of college you are in.

### Task 2:

Adjust your availabilities in the app.

### Task 3:

Add classes to your schedule and accept the default schedule.

### Task 4:

Go back and edit your schedule to include new free time and classes.

### Task 5:

Add a single event.

## Notes:

What changes should you make to your application:

- The advise classmates button does not currently lead to a screen.
- The day buttons at the top currently do not work.
- You cannot scroll the happening now section of the UI.

What you need to keep the same for your application:

- Users liked the general flow and layout.
- Users reported the design was clear and consistent.
- Users thought the scope was just right.
